Multi-Version Concurrency Control

15-445/645 FALL 2024 » PROF. ANDY PAVLO

ADMINISTRIVIA

Project #3 is due Sunday Nov 17th @ 11:59pm

Project #4 will be released this week.

Final Exam is on Friday Dec 13th @ 8:30am
→ Early exam will not be offered. Do not make travel plans.

Spring 2025 15-445/645 TA Applications (@523)

UPCOMING DATABASE TALKS

InfluxDB (DB Seminar)

- Monday Nov 11th @ 4:30pm
- Zoom

Camille Fournier (SCS'02)

- Distinguished Alumni Talk
- Thursday Nov 14th @ 4:30pm
- GHC 4401

JPMORGAN
CHASE & CO.

GlareDB (DB Seminar)

- Monday Nov 18th @ 4:30pm
- Zoom

LAST CLASS

We discussed concurrency control protocols for generating conflict serializable schedules without needing to know what queries a txn will execute.

The two-phase locking (2PL) protocol requires txns to acquire locks on database objects before they are allowed to access them.

MULTI-VERSION CONCURRENCY CONTROL

The DBMS maintains multiple physical versions of a single logical object in the database:

- When a txn writes to an object, the DBMS creates a new version of that object.
- When a txn reads an object, it reads the newest version that existed when the txn started.

MVCC HISTORY

Protocol was first proposed in 1978
MIT PhD dissertation.

First implementations was Rdb/VMS
and InterBase at DEC in early 1980s.

- Both were by Jim Starkey, co-founder of NuoDB.
- DEC Rdb/VMS is now “Oracle Rdb”.
- InterBase was open-sourced as Firebird.

Firebird

Rdb/VMS

MULTI-VERSION CONCURRENCY CONTROL

核心要点

Writers do not block readers.
Readers do not block writers.

Read-only txns can read a consistent snapshot 一致性快照 without acquiring locks.

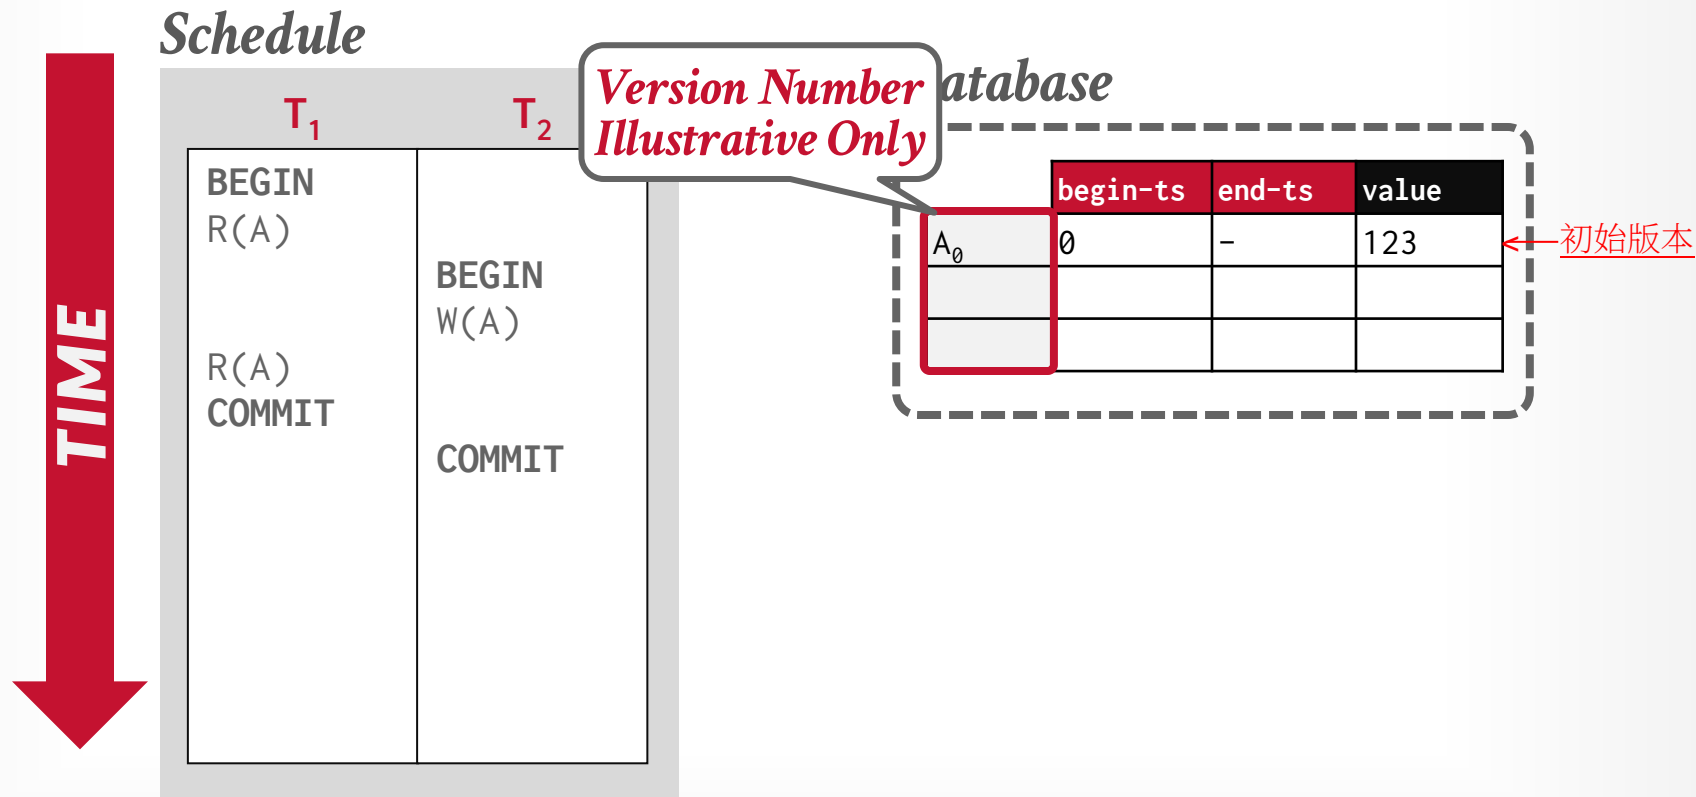

→ Use timestamps to determine visibility.

→ MVCC naturally supports Snapshot Isolation (SI). 快照隔离

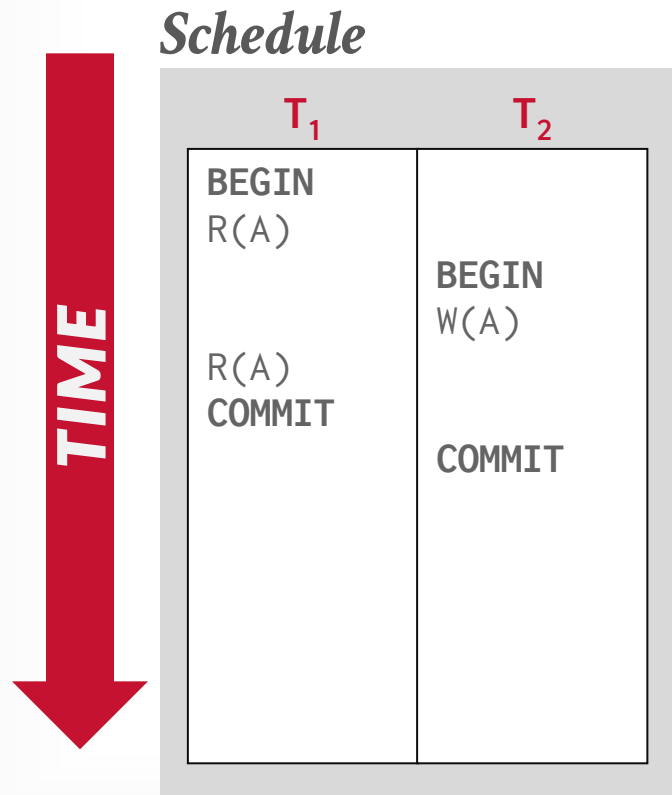

Multi-versioning without garbage collection allows the DBMS to support time-travel queries.

没有垃圾回收机制，从而支持数据的时间旅行查询，但会占据较大的存储空间。

Txn Status Table

txnid	timestamp	status
T_1	1	Committed
T_2	2	Active

MVCC - EXAMPLE #2

SNAPSHOT ISOLATION (SI)

When a txn starts, it sees a consistent snapshot of the database that existed when that the txn started.

→ No torn writes from active txns.

→ If two txns update the same object, then first writer wins.

SI is susceptible to the **Write Skew Anomaly**.

SI 容易受到写入倾斜的影响，因此 SI 不支持串行化。

WRITE SKEW ANOMALY

WRITE SKEW ANOMALY

WRITE SKEW ANOMALY

WRITE SKEW ANOMALY

MULTI-VERSION CONCURRENCY CONTROL

MVCC is more than just a concurrency control protocol. It completely affects how the DBMS manages transactions and the database.

MVCC DESIGN DECISIONS

Concurrency Control Protocol

Version Storage

Garbage Collection

Index Management

Deletes

CONCURRENCY CONTROL PROTOCOL

Approach #1: Timestamp Ordering

→ Assign txns timestamps that determine serial order.

Approach #2: Optimistic Concurrency Control

→ Three-phase protocol from last class.

→ Use private workspace for new versions.

Approach #3: Two-Phase Locking

→ Txns acquire appropriate lock on physical version before they can read/write a logical tuple.

VERSION STORAGE

The DBMS uses the tuples' pointer field to create a **version chain** per logical tuple.

- This allows the DBMS to find the version that is visible to a particular txn at runtime.
- Indexes always point to the **“head”** of the chain.

Different storage schemes determine where/what to store for each version.

VERSION STORAGE

***Don't
Do This!***

Approach #1: Append-Only Storage

→ New versions are appended to the same table space.

修改的新副本 ---> 插入原表：将产生大量的随机写，性能较差。

Approach #2: Time-Travel Storage

→ Old versions are copied to separate table space.

旧版本将存储在独立的旅行表空间，便于时间旅行。

Approach #3: Delta Storage

→ The original values of the modified attributes are copied into a separate delta record space.

增量日志仅存储需要修改的版本数据。

APPEND-ONLY STORAGE

All the physical versions of a logical tuple are stored in the same table space. The versions are inter-mixed.

On every update, append a new version of the tuple into an empty space in the table.

Main Table

	value	<i>pointer</i>
A_0	\$111	
A_1	\$222	\emptyset
B_1	\$10	\emptyset

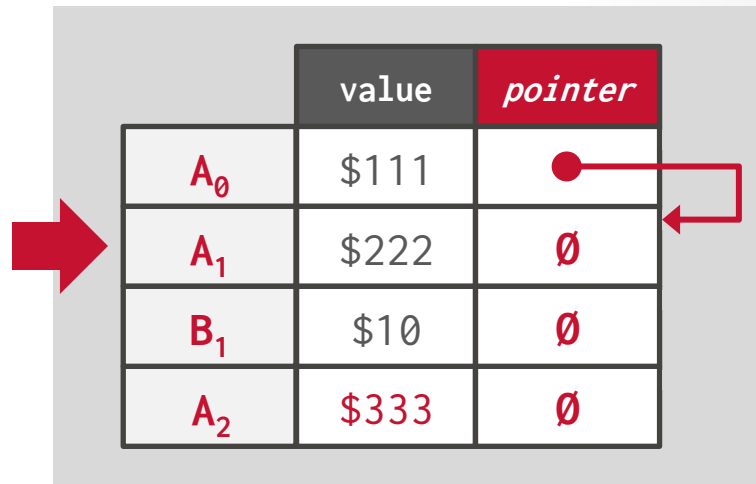

APPEND-ONLY STORAGE

All the physical versions of a logical tuple are stored in the same table space. The versions are inter-mixed.

On every update, append a new version of the tuple into an empty space in the table.

Main Table

The diagram illustrates the 'Main Table' structure. It is a table with three columns: 'value' and 'pointer'. The rows represent different versions of tuples. A large red arrow points to the table from the left. A red dot in the 'pointer' column of the first row has a red arrow pointing to the 'pointer' column of the second row, indicating a chain of pointers for updates.

	value	pointer
A_0	\$111	●
A_1	\$222	∅
B_1	\$10	∅
A_2	\$333	∅

APPEND-ONLY STORAGE

All the physical versions of a logical tuple are stored in the same table space. The versions are inter-mixed.

On every update, append a new version of the tuple into an empty space in the table.

Main Table

The diagram illustrates the Main Table structure. It is a table with two columns: 'value' and 'pointer'. The rows represent different versions of tuples. A red arrow points to the first row (A₀), and another red arrow points to the second row (A₁). The second row (A₁) is highlighted with a thick black border, indicating it is the current version of the tuple. The pointer column for A₁ contains an empty set symbol (∅), indicating it is the latest version and does not point to another row. The pointer column for A₀ contains a red dot, indicating it points to the next version (A₁).

	value	pointer
A ₀	\$111	●
A ₁	\$222	∅
B ₁	\$10	∅
A ₂	\$333	∅

APPEND-ONLY STORAGE

All the physical versions of a logical tuple are stored in the same table space. The versions are inter-mixed.

On every update, append a new version of the tuple into an empty space in the table.

Main Table

The diagram illustrates the 'Main Table' structure. It is a table with three columns: 'value' and 'pointer'. The first column contains tuple identifiers: A_0 , A_1 , B_1 , and A_2 . The 'value' column contains the corresponding values: '\$111', '\$222', '\$10', and '\$333'. The 'pointer' column contains pointers to the physical versions of the tuples. For A_0 and A_1 , the pointers are represented by red dots. For B_1 and A_2 , the pointers are empty (\emptyset). Red arrows indicate the physical storage of the tuples: a large red arrow points to the first row (A_0), and smaller red arrows point to the second row (A_1) and the fourth row (A_2). The third row (B_1) has no arrow, indicating it is not stored.

	value	pointer
A_0	\$111	●
A_1	\$222	●
B_1	\$10	\emptyset
A_2	\$333	\emptyset

VERSION CHAIN ORDERING

Approach #1: Oldest-to-Newest (O2N)

- Append new version to end of the chain.
- Must traverse chain on look-ups.

Approach #2: Newest-to-Oldest (N2O)

- Must update index pointers for every new version. 缺点
- Do not have to traverse chain on look-ups.
- This is typically the better approach because most txns only care about the newest version.

TIME-TRAVEL STORAGE

Main Table

	value	pointer
A_2	\$222	●
B_1	\$10	

Time-Travel Table

	value	pointer
A_1	\$111	\emptyset

On every update, copy the current version to the time-travel table. Update pointers.

TIME-TRAVEL STORAGE

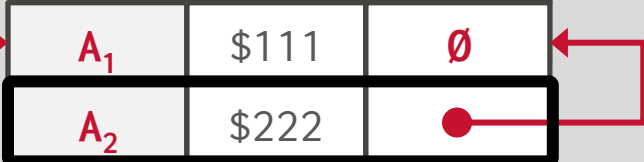

Main Table

	value	pointer
A_2	\$222	●
B_1	\$10	

Time-Travel Table

	value	pointer
A_1	\$111	\emptyset
A_2	\$222	●

On every update, copy the current version to the time-travel table. Update pointers.

TIME-TRAVEL STORAGE

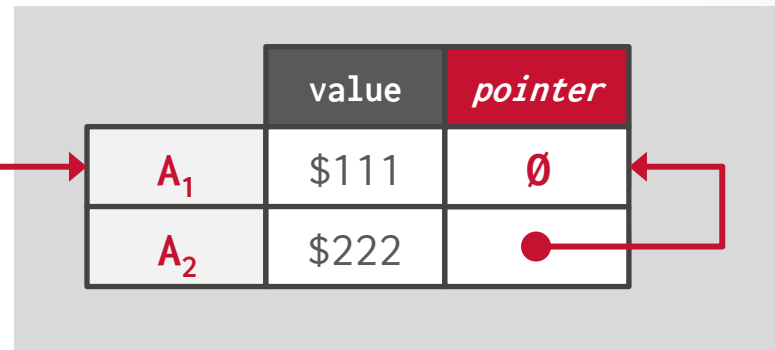

Main Table

	value	pointer
A₃	\$333	● →
B₁	\$10	

On every update, copy the current version to the time-travel table. Update pointers.

Time-Travel Table

	value	pointer
A₁	\$111	∅
A₂	\$222	● →

Overwrite master version in the main table and update pointers.

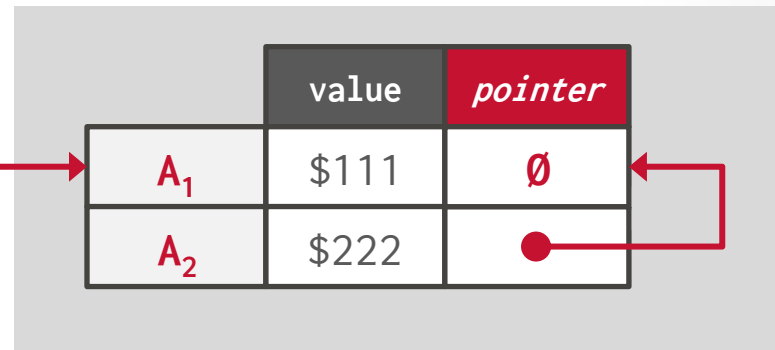

TIME-TRAVEL STORAGE

Main Table

	value	pointer
A ₃	\$333	● →
B ₁	\$10	

Time-Travel Table

	value	pointer
A ₁	\$111	∅
A ₂	\$222	● →

On every update, copy the current version to the time-travel table. Update pointers.

Overwrite master version in the main table and update pointers.

TIME-TRAVEL STORAGE

Main Table

	value	pointer
A_3	\$333	●
B_1	\$10	

Time-Travel Table

	value	pointer
A_1	\$111	\emptyset
A_2	\$222	●

On every update, copy the current version to the time-travel table. Update pointers.

Overwrite master version in the main table and update pointers.

DELTA STORAGE

Main Table

	value	<i>pointer</i>
A₁	\$111	
B₁	\$10	

Delta Storage Segment

On every update, copy only the column values that were modified to the delta storage and overwrite the master version.

DELTA STORAGE

Main Table

	value	pointer
A ₂	\$222	●
B ₁	\$10	

Delta Storage Segment

	delta	pointer
A ₁	(VALUE→\$111)	∅

On every update, copy only the column values that were modified to the delta storage and overwrite the master version.

DELTA STORAGE

Main Table

	value	pointer
A ₂	\$222	●
B ₁	\$10	

Delta Storage Segment

	delta	pointer
A ₁	(VALUE→\$111)	∅
A ₂	(VALUE→\$222)	●

On every update, copy only the column values that were modified to the delta storage and overwrite the master version.

DELTA STORAGE

Main Table

	value	pointer
A ₃	\$333	●
B ₁	\$10	

Delta Storage Segment

	delta	pointer
A ₁	(VALUE→\$111)	∅
A ₂	(VALUE→\$222)	●

On every update, copy only the column values that were modified to the delta storage and overwrite the master version.

DELTA STORAGE

Main Table

	value	pointer
A ₃	\$333	●
B ₁	\$10	

Delta Storage Segment

	delta	pointer
A ₁	(VALUE→\$111)	∅
A ₂	(VALUE→\$222)	●

On every update, copy only the column values that were modified to the delta storage and overwrite the master version.

Txns can recreate old versions by applying the delta in reverse order.

GARBAGE COLLECTION

The DBMS needs to remove reclaimable physical versions from the database over time.

- No active txn in the DBMS can “see” that version (SI).
- The version was created by an aborted txn.

Two additional design decisions:

- How to look for expired versions?
- How to decide when it is safe to reclaim memory?

GARBAGE COLLECTION

Approach #1: Tuple-level

- Find old versions by examining tuples directly.
- Background Vacuuming vs. Cooperative Cleaning
专有的后台工作线程执行清理操作 扫描数据的同时进行清理

Approach #2: Transaction-level

- Txns keep track of their old versions so the DBMS does not have to scan tuples to determine visibility.

TUPLE-LEVEL GC

Txn #1

$T_{id}=12$

Txn #2

$T_{id}=25$

Vacuum

	begin-ts	end-ts
A_{100}	1	9
B_{100}	1	9
B_{101}	10	20

Background Vacuuming:

Separate thread(s) periodically scan the table and look for reclaimable versions. Works with any storage.

TUPLE-LEVEL GC

Txn #1

$T_{id}=12$

Txn #2

$T_{id}=25$

Vacuum

	begin-ts	end-ts
A_{100}	1	9
B_{100}	1	9
B_{101}	10	20

Background Vacuuming:

Separate thread(s) periodically scan the table and look for reclaimable versions. Works with any storage.

TUPLE-LEVEL GC

Txn #1

$T_{id}=12$

Txn #2

$T_{id}=25$

Vacuum

	begin-ts	end-ts
A_{100}	1	9
B_{100}	1	9
B_{101}	10	20

Background Vacuuming:

Separate thread(s) periodically scan the table and look for reclaimable versions. Works with any storage.

根据开始和结束时间戳决定数据版本对当前活跃事务是否可见，若不可见则执行删除操作。

TUPLE-LEVEL GC

Txn #1

$T_{id}=12$

Txn #2

$T_{id}=25$

Vacuum

	begin-ts	end-ts
B_{101}	10	20

Background Vacuuming:

Separate thread(s) periodically scan the table and look for reclaimable versions. Works with any storage.

TUPLE-LEVEL GC

	begin-ts	end-ts
B_{101}	10	20

Background Vacuuming:
Separate thread(s) periodically scan the table and look for reclaimable versions. Works with any storage.

为了提高后台线程执行垃圾回收扫描的效率，可以引入 **bitmap** 表示某个页是否被修改，若修改则将对应的位设置为 1。

当后台工作线程被唤醒后，根据脏位图中标记的页面修改情况，扫描对应页面中可以批量回收的数据版本，从而释放空间。

TUPLE-LEVEL GC

Txn #1

$T_{id}=12$

Txn #2

$T_{id}=25$

Vacuum

Dirty Block BitMap

	begin-ts	end-ts
B_{101}	10	20

Background Vacuuming:

Separate thread(s) periodically scan the table and look for reclaimable versions. Works with any storage.

TUPLE-LEVEL GC

Txn #1

$T_{id}=12$

Txn #2

$T_{id}=25$

Vacuum

	begin-ts	end-ts
B_{101}	10	20

Background Vacuuming:

Separate thread(s) periodically scan the table and look for reclaimable versions. Works with any storage.

TUPLE-LEVEL GC

Background Vacuuming:

Separate thread(s) periodically scan the table and look for reclaimable versions. Works with any storage.

Cooperative Cleaning:

Worker threads identify reclaimable versions as they traverse version chain. Only works with O2N.

TUPLE-LEVEL GC

Background Vacuuming:

Separate thread(s) periodically scan the table and look for reclaimable versions. Works with any storage.

Cooperative Cleaning:

Worker threads identify reclaimable versions as they traverse version chain. Only works with O2N.

TUPLE-LEVEL GC

Background Vacuuming:

Separate thread(s) periodically scan the table and look for reclaimable versions. Works with any storage.

Cooperative Cleaning:

Worker threads identify reclaimable versions as they traverse version chain. Only works with O2N.

TUPLE-LEVEL GC

Background Vacuuming:

Separate thread(s) periodically scan the table and look for reclaimable versions. Works with any storage.

Cooperative Cleaning:

Worker threads identify reclaimable versions as they traverse version chain. Only works with O2N.

TRANSACTION-LEVEL GC

Each txn keeps track of its read/write set.

On commit/abort, the txn provides this information to a centralized vacuum worker.

The DBMS periodically determines when all versions created by a finished txn are no longer visible.

INDEX MANAGEMENT

Primary key indexes point to version chain head.

- How often the DBMS must update the pkey index depends on whether the system creates new versions when a tuple is updated.
- If a txn updates a tuple's pkey attribute(s), then this is treated as a **DELETE** followed by an **INSERT**. 先删除后插入

Secondary indexes are more complicated...

Secondary in

SECONDARY INDEXES

Approach #1: Logical Pointers

- Use a fixed identifier per tuple that does not change.
- Requires an extra indirection layer.
- **Primary Key** vs. Tuple Id

MySQL 的二级索引（非聚簇索引）存储的是主键索引，然后通过 PKey 查找实际数据位置。

Approach #2: Physical Pointers

- Use the physical address to the version chain head.

INDEX POINTERS: APPEND-ONLY

INDEX POINTERS: APPEND-ONLY

MVCC INDEXES

MVCC DBMS indexes (usually) do not store version information about tuples with their keys.
→ Exception: Index-organized tables (e.g., MySQL)

Every index must support duplicate keys from different snapshots:
→ The same key may point to different logical tuples in different snapshots.

MVCC INDEXES

Each index's underlying data structure must support the storage of non-unique keys.

Use additional execution logic to perform conditional inserts for pkey / unique indexes.

→ Atomically check whether the key exists and then insert.

Workers may get back multiple entries for a single fetch. They then must follow the pointers to find the proper physical version.

MVCC DELETES

The DBMS physically deletes a tuple from the database only when all versions of a logically deleted tuple are not visible.

- If a tuple is deleted, then there cannot be a new version of that tuple after the newest version.
- No write-write conflicts / first-writer wins

We need a way to denote that tuple has been logically delete at some point in time.

MVCC DELETES

Approach #1: Deleted Flag

- Maintain a flag to indicate that the logical tuple has been deleted after the newest physical version.
- Can either be in tuple header or a separate column.

Approach #2: Tombstone Tuple

- Create an empty physical version to indicate that a logical tuple is deleted.
- Use a separate pool for tombstone tuples with only a special bit pattern in version chain pointer to reduce the storage overhead.

MVCC IMPLEMENTATIONS

	<i>Protocol</i>	<i>Version Storage</i>	<i>Garbage Collection</i>	<i>Indexes</i>
Oracle	MV2PL	Delta	Vacuum	Logical
Postgres	MV-2PL/MV-TO	Append-Only	Vacuum	Physical
MySQL-InnoDB	MV-2PL	Delta	Vacuum	Logical
HYRISE	MV-OCC	Append-Only	–	Physical
Hekaton	MV-OCC	Append-Only	Cooperative	Physical
MemSQL (2015)	MV-OCC	Append-Only	Vacuum	Physical
SAP HANA	MV-2PL	Time-travel	Hybrid	Logical
NuoDB	MV-2PL	Append-Only	Vacuum	Logical
HyPer	MV-OCC	Delta	Txn-level	Logical
CockroachDB	MV-2PL	Delta (LSM)	Compaction	Logical

CONCLUSION

MVCC is the widely used scheme in DBMSs.
Even systems that do not support multi-statement txns (e.g., NoSQL) use it.
